

Home based program participants utilize industry standard neurofeedback equipment in their homes under the direct supervision of a licensed professional and support team. Participants are taught how to correctly use the neurofeedback equipment and software to properly follow their assigned protocols. Each participant meets remotely with a licensed professional on a regular basis, completes behavioral assessments on a weekly basis to measure progress, is re-assessed to obtain updated EEG data and 3d spectrums throughout training, and re-takes the Cambridge Brain Sciences Health test at multiple points in training to analyze progress. Most home-based participants complete around 40 sessions of training in the course of 3 months. Multiple family members can participant in training at the same time.

### **Included in program:**

- Neurofeedback Unit and laptop computer (to be returned upon completion)
- Training and support to use equipment
- Online monitoring of sessions and technical support
- Weekly sessions with clinician to discuss clinical progress
- Weekly behavioral assessments
- Re-testing at regular intervals to assess progress, including cognitive re-testing via the Cambridge Brain Sciences Health test.
